

Vibe-coded MVP → production-grade.

What a decade of shipping software teaches you to look for early.

The demo works.
The prototype ships.
Ten users love it.

Then user eleven shows up on Safari.

The gap between "it runs" and "it runs reliably" **hasn't shrunk.**

It's gotten quieter.

Bugs that used to surface in week two now surface at \$50k MRR — when there's a contract and an SLA attached.

-
- 01 Which corners are safe to cut — and which come back as a 2am page.
-
- 02 The architecture choices that scale 100 → 100k without a rewrite.
-

03 The one query, in a codebase you've never seen, running the bill up.

04 The boring infrastructure — backups, monitoring, secrets, rollbacks — written before it's needed.

None of it is glamorous.

It's the difference between a demo and a business.

8bar

ENGINEERED OUTCOMES.
